June 18, 2008

**Wireless Computing Ships Winning Wireless Keyboard**

**100-ft range, optical trackball and encryption help this keyboard lap the field**

Do you need a wireless keyboard with 100-foot range? You might, if you use your computer in a corporate conference room, training room or auditorium. Priced at \$199 (SRP), Wireless Computing's new RF-222 Wireless Keyboard with Optical Trackball isn't cheap. But it could be the right keyboard to help you finish first in your business career.

The RF-222's low-profile design and attractive aesthetics show this is not Wireless Computing's first time at the racetrack. Precision-engineered scissors keys give a smooth typing feel, even when keys are pressed off-center. The optical trackball responds to a light touch with precise cursor control. And when you use the RF-222 in crowded corporate environments, keystroke encryption and 32,000+ digital addresses guard against crosstalk and illicit interception.

The RF-222 is ready to go right off the trailer. Simply plug the USB receiver into your Windows XP/Vista computer. As the miles add up, the RF-222 avoids unscheduled pit stops by running for months on two AA alkaline batteries.

Next time you use a computer in front of an audience, go for the checkered flag with the RF-222 Wireless Keyboard with Optical Trackball.

**About Wireless Computing**

Wireless Computing, Inc. designs and manufactures high-performance wireless computer peripherals. Their wireless keyboards, mice and presentation controllers are used in corporations, educational institutions, high-end home media centers, and government facilities worldwide.
